

What are the best practices when working with a plain text Bulletin?

Michael C. - 2021-03-23 - Bulletins

As part of email best practices, ClubRunner sends a text version of your bulletin for email clients that cannot render the HTML email. We've introduced the ability to customize the content in the text version of your bulletins. You will notice a link titled 'Text Version' on the top right of your bulletin editor to be able to create and edit text versions of your bulletin.

What is a Plain Text Bulletin?

A plain text bulletin is an email that does not contain any images or text formatting. When creating your bulletin using the Bulletin Designer, you are creating an HTML version of your bulletin, complete with formatting and imagery. Because emails are viewed on different email clients and devices, with plain text emails you can be assured that no information is lost in translation.

Guidelines for creating a plain text Bulletin

To create a plain text email, simply copy over your content brief from your bulletin into the space provided.

Ensure you space your content out appropriately, and provide lots of white space between the various stories, to make it easy to read. If adding a URL, try to use short URLs where possible, as a longer URL can sometimes break or become difficult to copy. If you are unable to acquire a short URL for your story on ClubRunner, consider using URL shortening tools like bit.ly. This link will open in a new window.

Why is a text version important?

Although, creating and editing the text version is optional, it is highly recommended as recipients that have email clients that do not render HTML emails will not be able to see your bulletin content. Some browsers or settings on email clients such as Outlook don't support HTML versions of emails. When this is the case, the recipient receives the text version of your email instead.

Additionally, if your HTML email is content heavy (bulletin contains a lot of information and

images), and it is not supported by a text version, spam filters are more likely to mark your email as spam, which means the recipient might not receive your email.
